

Microarray analysis of viral infections

Dipl. Biol. Stefanie Müller

Department of Virology

Bernhard Nocht Institute for Tropical
Medicine

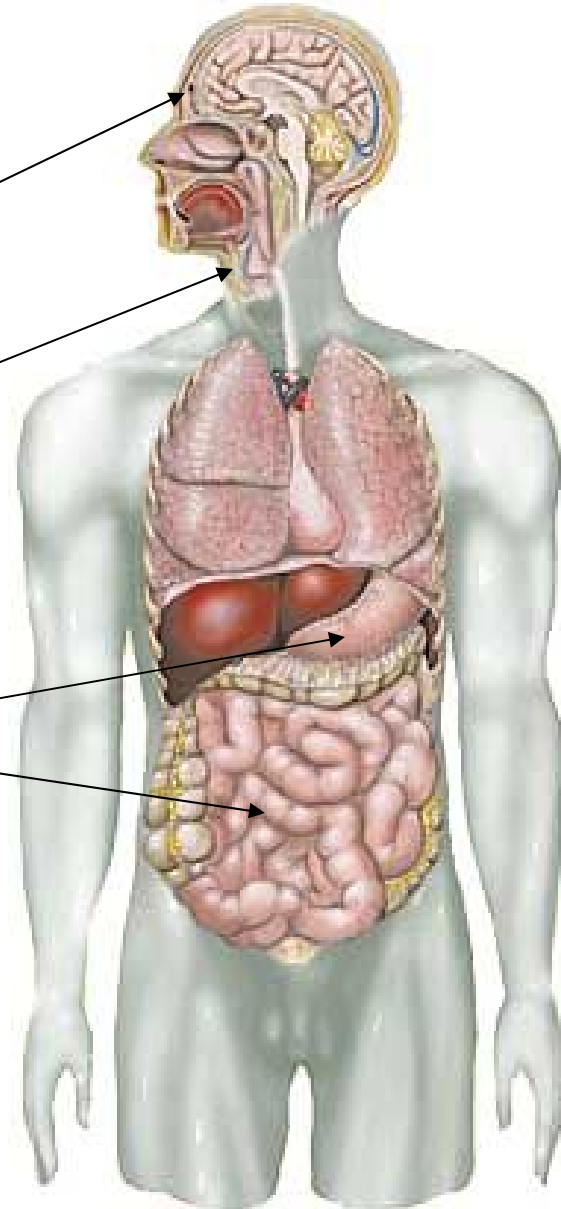

- Possible investigations of viral infections
- Description of symptoms → patient
- Analysis of affected organs → Pathology, blood
- Investigation of affected cells → Microarray analysis, Protein analysis

Lassa infection

Symptoms:

- fever
- severe headache, sore throat
- abdominal pain
- Hepatitis
- hemorrhaghe

Lassa infection

- Affected organs
- example liver
- pathological diagnosis

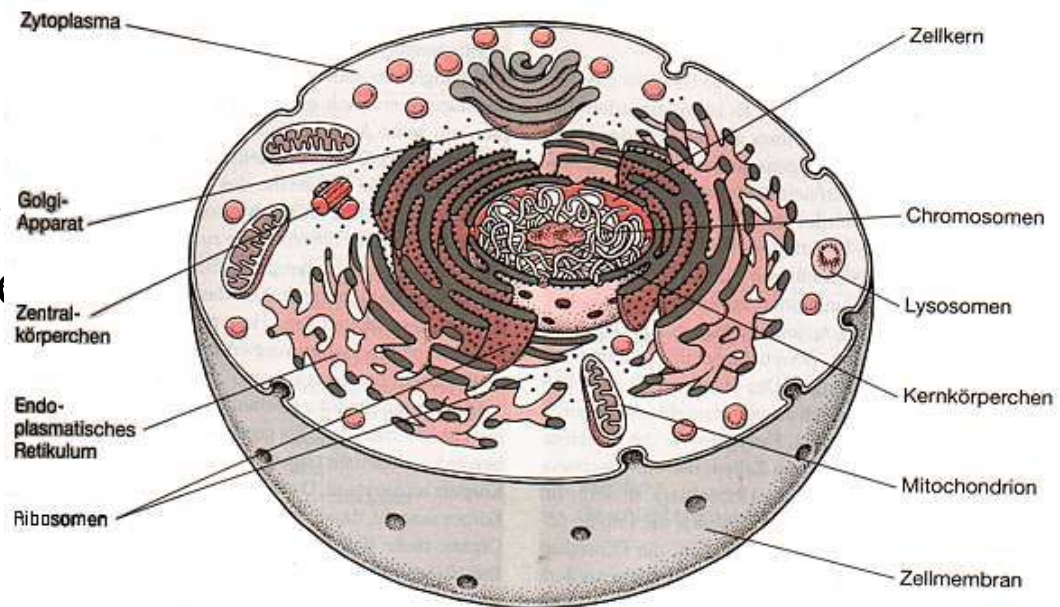

Lassa infection

- Investigation of affected cells
- Electron microscopy:
 - cell shape
 - CPE
 - viral particles

Lassa infection

- Events inside the infected cells
- Visualisation problem
- Possibility to solve the problem: analyse the cellular signals with DNA microarrays

Scheme of experimental procedure

- What are microarrays?

- **Microarray Experiments**
- Infection of model cells with Lassa
- Isolation of mRNA from the infected cells
- Labelling of mRNA
- Hybridisation of mRNA to the array
- Detection of the signals
- Computer analysis of the signals

- **Cell culture and virus infection**
- Growth of cells on media
- Application of virus
- Growth of virus

- **Control of virus infection**
- Detection of virus inside the cells with antibodies

- **Isolation of mRNA**
- Destruction of cell membrane
- Isolation of mRNA from the cytoplasm
- Detection of mRNA-control of isolation

- **Microarray Analysis-scheme**

- Array

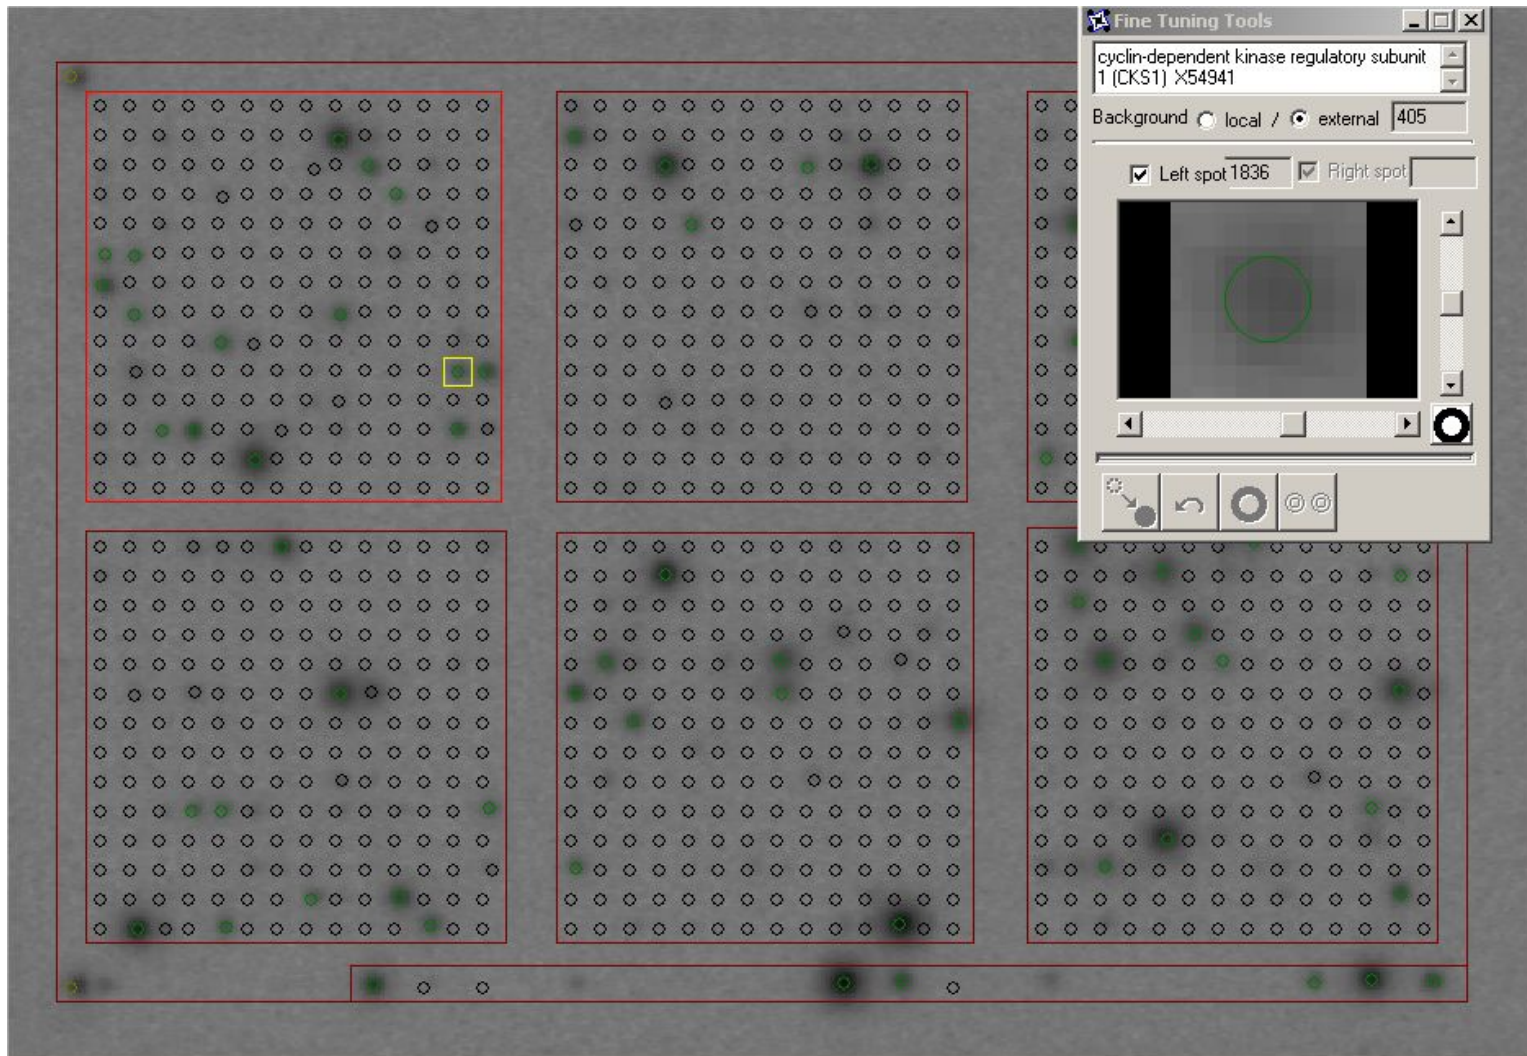

Lassa array I

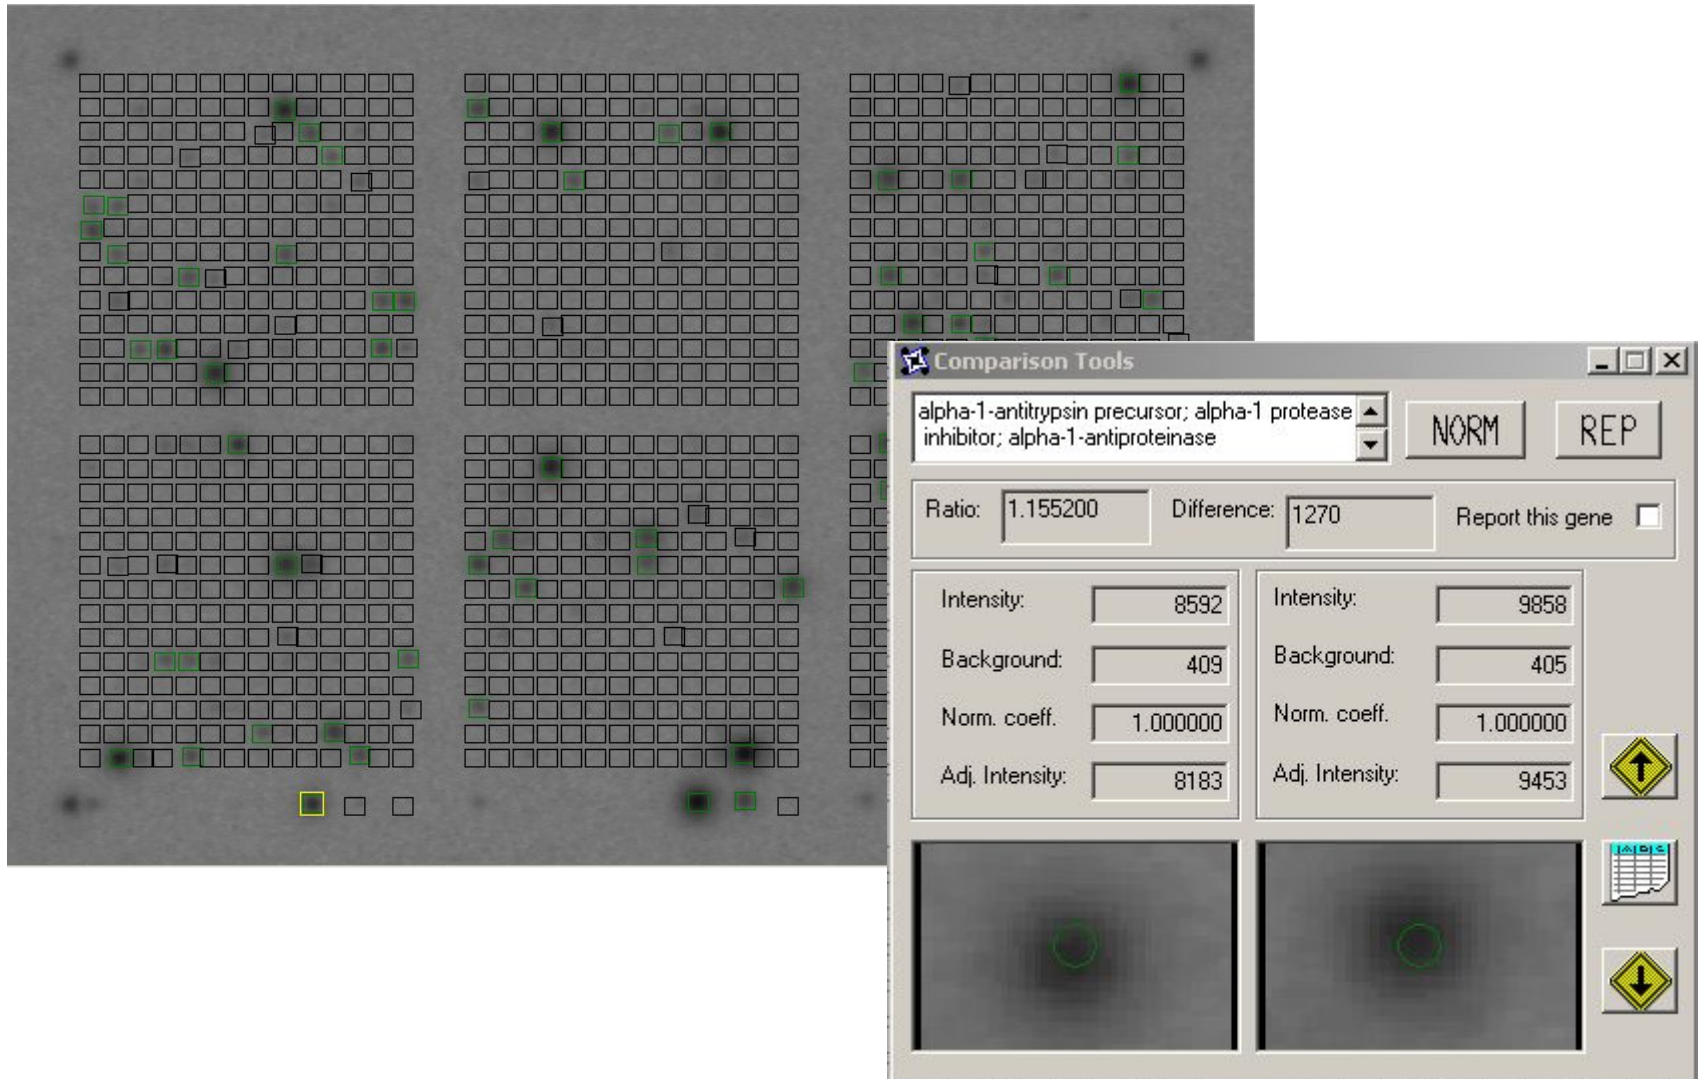

Control array I

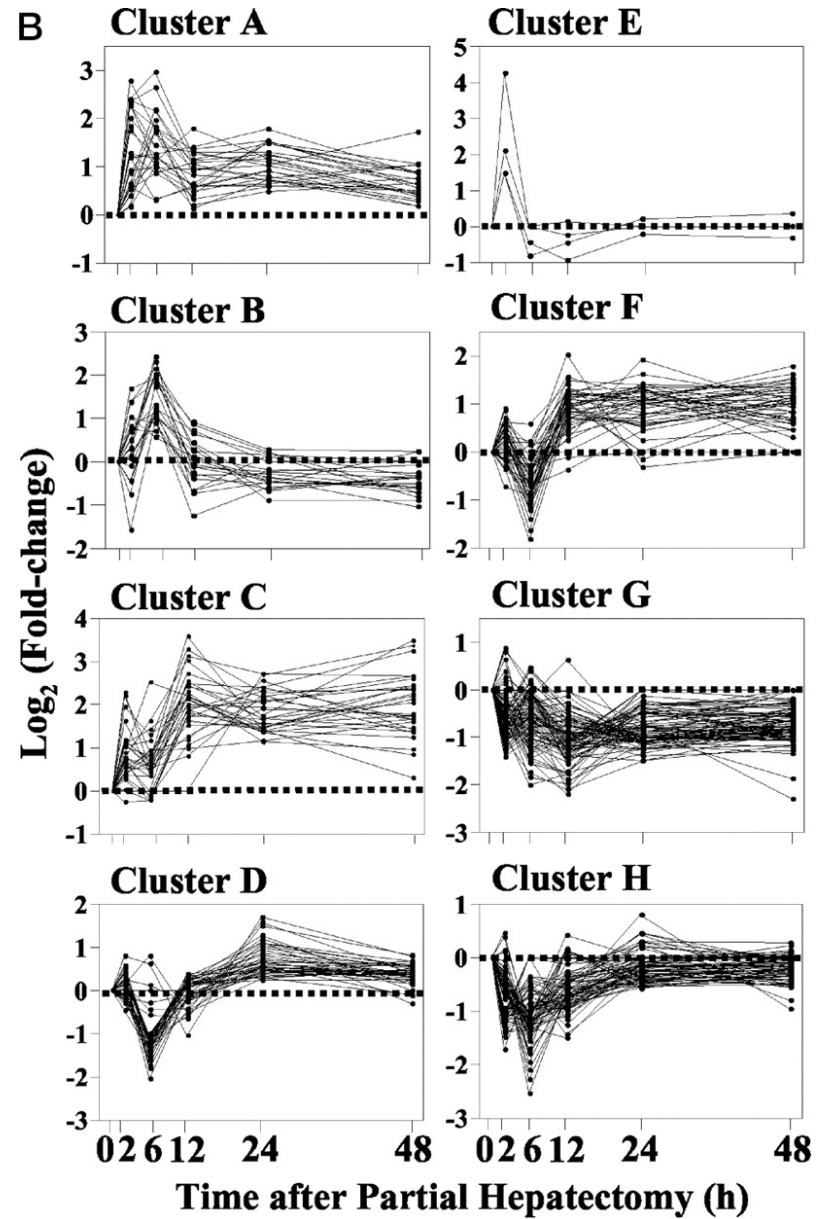

- Alignment Lassa Array

- Comparison Lassa-control

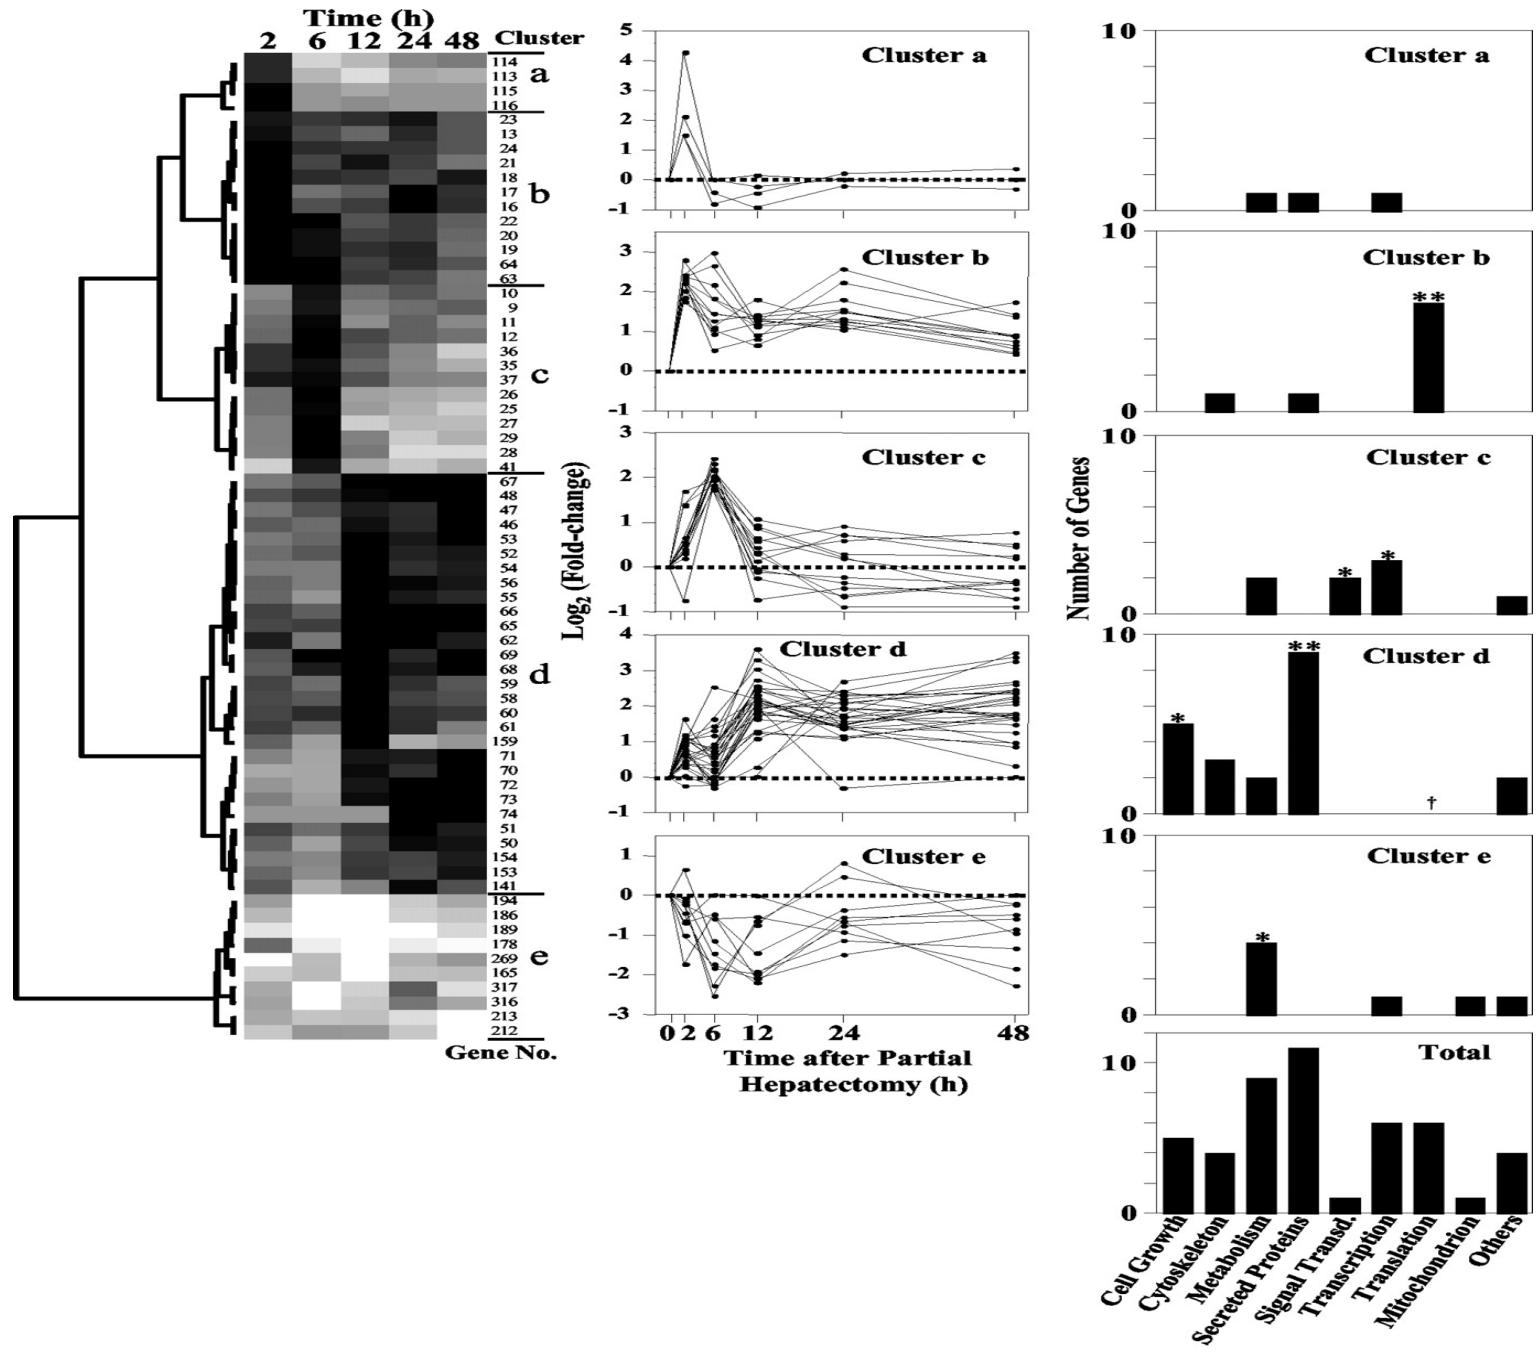

- Data analysis
- Comparison of infected cells and control cells
- Comparison of several experiments:
- Question:
Which genes are affected by the same external parameters?
Are there gene clusters regulated together?
- Technical solution: cluster analysis

- Do the genes within the cluster belong to special biological groups
- Clustering because of biological function

- **Add-ons**
- working with Lassa virus
- because of high mortality rate of 30% and the lack of an accurate therapy Lassa virus is classified as BSL4 organism
- This implicates working under special conditions

The biosafety levels and classification of organisms

- 1: not harmful for humans and environment
E. coli, Streptomyces spc
- 2: little danger for humans and environment
S. pneumoniae
- 3: high danger for humans and environment
HIV
- 4: extremely dangerous for humans and environment
Lassa, Ebola, Marburg

- Working in a BSL4 laboratory
- special laboratories, 2x in Germany
- special air systems, restricted area, decontamination of personal and material
- special equipment for people working in the lab
