

Übungsblatt 14*

Präsenzübungen

P58. Betrachten Sie die Stichprobe 100, 97, 101, 96, 98, 102, 96, 100, 101, 98. Schätzen Sie Erwartungswert und Varianz der Grundgesamtheit.

P59. Eine Stichprobe vom Umfang $n = 100$ aus einer normalverteilten Grundgesamtheit mit Standardabweichung $\sigma = 0.1$ ergab $\bar{X} = 5.2$.

- In welchem Intervall liegt der Erwartungswert μ mit Sicherheit $1 - \alpha = 0.95$?
- In welchem Intervall liegt der Erwartungswert μ zu 100%?

P60. Betrachten Sie die Stichprobe 100, 96, 101, 97, 98, 102, 96, 100, 101, 98.

- Schätzen Sie den Erwartungswert und bestimmen Sie das Konfidenzintervall zum Niveau $1 - \alpha = 90\%$.
- Angenommen, die Varianz $\sigma^2 = 3$ wäre bekannt. Schätzen Sie nun den Erwartungswert und bestimmen Sie das Konfidenzintervall zum Niveau $1 - \alpha = 90\%$.

P61. Sei $\{x_1, \dots, x_n\}$ eine Stichprobe von Zahlen. Eine alternative Definition des Medians x_m ist: Der Median minimiert die Summe

$$M(x) = \sum_{i=1}^n |x - x_i|,$$

d. h. für $x = x_m$ ist M minimal. Eine alternative Definition des arithmetischen Mittels \bar{x} ist: Das arithmetische Mittel minimiert den Ausdruck

$$A(x) = \sqrt{\sum_{i=1}^n (x - x_i)^2},$$

d. h. für $x = \bar{x}$ ist A minimal.

- Machen Sie sich für $n \in \{3, 4\}$ klar, dass die obige Definition des Medians mit der aus der Vorlesung übereinstimmt.
- Zeigen Sie, dass die obige Definition des arithmetischen Mittels mit der Definition aus der Vorlesung übereinstimmt. (**Hinweis:** Nutzen Sie die Monotonie der Wurzelfunktion)

Tabelle der Werte der Standardnormalverteilung $\Phi(x)$ für $0.00 \leq x \leq 4.59$.
